Village of Caldwell Water Works
Consumer Confidence Report

2020

Caldwell Water Works

Water Quality Data Table 2020

The table below lists all of the drinking water contaminants we detected that are applicable for the calendar year of this report...

The presence of contaminants in the water does not necessarily indicate that the water poses a health risk. Unless otherwise noted, the data presented in this table is from testing done in the calendar year of the report. The EPA or the State requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently.

Contaminants (Units)	MCLG	MCL	Level Found	Range of Detections	Violations	Sample Year	Typical Source of Contaminants
----------------------	------	-----	-------------	---------------------	------------	-------------	--------------------------------

Inorganic Contaminates

Fluoride (ppm)	4	4	1.2	0.83 - 1.2	NO	2020	Erosion of natural deposits: Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Nitrate (ppm)	10	10	0.608	0.20 - 0.608	NO	2020	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits
Barium (ppm)	2	2	0.100	NA	NO	2020	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits
Lead (ppb)	0	AL=15	<4*AA	NA	NO	2017	Corrosion of household plumbing systems.

***AA indicates Below Detectable Level**

Zero out of twenty samples were found to have lead levels in excess of the lead action level of 15 ppb.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Village of Caldwell Water Works Treatment Plant is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at <http://www.epa.gov/safewater/lead>.

Copper (ppm)	1.3	AL=1.3	0.024	NA	NO	2017	Corrosion of household plumbing systems.
--------------	-----	--------	-------	----	----	------	--

Zero out of twenty samples were found to have copper levels in excess of the copper action level of 1.3 ppm.

Microbiological Contaminants

Turbidity (NTU)	NA	TT	0.26	0.04 - 0.26	NO	2020	Soil Runoff
Turbidity % Samples meeting standard	NA	TT	100%	NA	NO	2020	
Total Organic Carbon	NA	TT	1.92	0.94 - 3.12	YES	2020	Naturally present in the environment

The value reported under "Level Found" for Total Organic Carbon (TOC) is the lowest ratio between percentages of TOC actually removed to the percentage of TOC required to be removed. A value of greater than one (1) indicates that the water system is in compliance with TOC removal requirements. A value of less than one (1) indicates a violation of the TOC requirements.

Total organic carbon (TOC) has no health effects. However, total organic carbon provides a medium for the formation of disinfection byproducts. These byproducts include trihalomethanes (THM) and haloacetic acids (HAAs). Drinking water containing these byproducts in excess of the MCL may lead to adverse health effects, liver or kidney problems, or nervous system effects, and may lead to an increased risk of getting cancer.

Caldwell WaterWorks Water Quality Data Table 2020 (cont.)

Turbidity is a measure of the cloudiness of water and is an indication of the effectiveness of our filtration system. The turbidity limit set by the EPA is **0.3 NTU** in 95% of the daily samples and shall not exceed 1 NTU at any time. As reported above the Village of Caldwell water systems highest recorded turbidity result for **2020** was **0.26 NTU** and lowest monthly percentage of samples meeting the turbidity limits was 100%.

Contaminants (Units)	MCLG	MCL	Level Found	Range of Detections	Violations	Sample Year	Typical Source of Contaminants
----------------------	------	-----	-------------	---------------------	------------	-------------	--------------------------------

Residual Disinfectants

Chlorine (ppm)	MRDLG= 4	MRDL= 4	1.52	1.21 – 1.80	NO	2020	Water additive used to control microbes
----------------	-------------	------------	------	-------------	----	------	---

DBP – Volatile Organic Contaminants

Trihalomethanes (ppb)	0	80	44.1	12.1 – 43.6	NO	2020	By-product of drinking water chlorination
Haloacetic Acids (ppb)	0	60	34.0	9.2 – 54.6	NO	2020	By-product of drinking water chlorination

At this time we have had zero detection on all UCMR samples.

Unregulated contaminants are those for which EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to assist EPA in determining the occurrence of unregulated contaminants in drinking water and whether future regulation is warranted. For a copy of the results please call Keith Grewell @ 740-732-2552.

DRINKING WATER NOTICE

Microcystins monitoring requirements not met for Caldwell Village PWS

We are required to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. During the week of December 8, 2019, we did not monitor for total microcystins and therefore cannot be sure of the quality of our drinking water during that time.

What Should I Do?

This notice is to inform you that Caldwell Village PWS did not monitor, and report results for the presence of microcystins in the public drinking water system during the week December 8, 2019 monitoring period, as required by the Ohio Environmental Protection Agency. You do not need to take any action in response to this notice.

What is being done?

Upon being notified of this violation, the water supply was required to have the drinking water analyzed for total microcystins according to their current monitoring schedule. The water supplier will take steps to ensure that adequate monitoring will be performed in the future.

A sample was collected on 12/17/2019.

Sample results and additional information may be obtained by contacting Caldwell Village PWS at:

Contact Person: Joe Frederickson or Keith Grewell

Phone Number: (740) 732-2552

Mailing Address: Caldwell Water Works

45081 Marietta Road,

Caldwell, Ohio 43724

Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.

PWSID: OH6100011 Facility ID: 6156878

Date Distributed: ____3/31/2021 – To Satellites____

Tier 3: Monitoring Violation Notice

Caldwell Water Works

CCR 2020

Is my water safe?

Caldwell Water Works Treatment Plant, along with the U.S.E.P.A. and the Ohio E.P.A., vigilantly works to deliver the highest quality drinking water possible to our consumers. The purpose of this report is to keep you informed on what contaminants were found in the water, what effects they have, and what is being done to alleviate any problems that may be encountered.

Do I need to take special precautions?

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Water Drinking Hotline (800-426-4791).

Where does my water come from?

Our water sources are Wolf Run Lake and Caldwell Lake. The consistently better-quality water available from Wolf Run Lake makes it our primary source. Wolf Run is a 220-acre lake located 1/2 mile east of the Belle Valley interchange at the junction of I-77 and S.R. 821. Intakes were constructed at the dam and the lake also has areas for swimming, fishing and boating. Caldwell Lake is located approximately 1 mile east of S.R. 821 and Noble Co. Rd. 127. The lake has a 500-million-gallon storage capacity. 3-level intakes are located at the dam.

Why are there contaminants in my drinking water?

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's (EPA) Safe Drinking Water Hotline (800-426-4791). The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Microbial contaminants, such as viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife. Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming. Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses. Organic Chemical Contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also, come from gas stations, urban storm water runoff, and septic systems. Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

How can I get involved?

If you have any questions about this report or concerning your water utility, or you would just like to be involved and keep informed, please contact Joe Frederickson, Water Works Superintendent at 732-2552. We want our valued customers to be informed about their water utility. Because of the CoVid pandemic we only hold meetings online via ZOOM at this time. Information on how to attend and times of the meetings can be obtained at City Hall, or by calling 740-732-4645. Public participation is encouraged!

Source water assessment and its availability.

For the purposes of source water assessments, in Ohio all surface waters are considered to be susceptible to contamination. By their nature, surface waters are readily accessible and can be contaminated by chemicals and pathogens which may rapidly arrive at the public drinking water intake with little warning or time to prepare. The Village of Caldwell Water public water system treats the water to meet drinking water quality standards, but no single treatment technique can address all potential contaminants. The potential for water quality impacts can be further decreased by implementing measures to protect Wolf Run Lake and Caldwell Lake. More detailed information is provided in the Village of Caldwell's drinking Water Source Assessment report, which can be obtained by scheduling an appointment with Joe Frederickson, Water Works Superintendent at 740-732-2552.

Unit Descriptions

<u>Term</u>	<u>Definition</u>
ppm	ppm: parts per million, or milligrams per liter(mg/L) A part per million corresponds to one second in approximately 11.5 days.
ppb	ppb: parts per billion, or micrograms per liter (ug/L) A part per billion corresponds to one second in 31.7 years.
NTU	NTU: Nephelometric Turbidity Units. Turbidity is a measure of the cloudiness of the water. We monitor it because it is a great indicator of the effectiveness of our filtration system.
NA	NA: not applicable
ND	ND: non detected
NR	NR: Monitoring not required, but recommended

Important Drinking Water Definitions

<u>Term</u>	<u>Definition</u>
MCLG	Maximum Contaminant Level Goal (MCLG): The level of contaminant in drinking water below which there is no known or expected risk to health. MCLG's allow for a margin of safety.
MCL	Maximum Contaminant level (MCL): The highest level of contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
TT	Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.
AL	Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.
Variances and Exemptions	Variances and exemptions: State or EPA permission not to meet an MCL or treatment technique under certain conditions.
MRDLG	Maximum Residual Disinfectant Level Goal (MRDLG): The level of drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
MRDL	Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
MNR	Monitored Not Regulated (MNR)
MPL	Maximum Permissible Level state assigned (MPL)
UCMR	Unregulated Contaminant Monitoring Rule (UCMR): Unregulated contaminants are those for which EPA has not established drinking water standards.

We have a current unconditional license to operate our water system.
